- Visual discrimination
- Spatial reasoning
- Problem-solving
- Memory
- Attention

Nonverbal reasoning is important for everyday life. It helps us to make sense of the world around us, to interact with others, and to learn new things.

The developmental timeline for nonverbal reasoning is not set in stone. However, there are some general trends that researchers have observed.

****Infancy****

Infants begin to develop nonverbal reasoning skills early on. They can learn to recognize and respond to facial expressions as early as 2 months of age.

By the end of their first year, infants are able to solve simple problems, such as finding a hidden object. They can also learn to use gestures to communicate.

****Toddlerhood****

Toddlers' nonverbal reasoning skills continue to develop rapidly. They become more proficient at solving problems and using gestures. They also begin to understand more complex social situations.

By the end of their second year, toddlers are able to understand and use simple symbols, such as pictures and diagrams.

****Preschool****

Preschoolers' nonverbal reasoning skills continue to improve. They become more adept at solving problems and using symbols. They also begin to understand more complex social interactions.

By the end of their fifth year, preschoolers are able to understand and use complex symbols, such as maps and charts. They can also solve more

complex problems and reason about the future.

****School Age****

School-age children's nonverbal reasoning skills continue to develop throughout their elementary and middle school years. They become more proficient at solving problems and reasoning about complex concepts.

By the end of their high school years, adolescents are able to solve complex problems and reason about abstract concepts. They can also understand and use complex symbols and understand social interactions and relationships.

****Adulthood****

Adult nonverbal reasoning skills continue to develop and change throughout adulthood. As adults gain experience and knowledge, they become better at solving problems, reasoning about complex concepts, and understanding social interactions and relationships.

The development of nonverbal reasoning is a complex and ongoing process. It is influenced by a variety of factors, including genetics, environment, and education.

If you are concerned about your child's nonverbal reasoning skills, talk to your doctor or a child development specialist. They can assess your child's skills and provide you with recommendations for how to support their development.

Here are some tips for supporting your child's nonverbal reasoning skills:

- **Talk to your child** about their thoughts and feelings.
- **Read to your child** and ask them questions about the story.
- **Play games that require problem-solving**, such as puzzles and board games.
- **Encourage your child to use gestures** to communicate.
- **Expose your child to different cultures** and languages.
- **Be patient and supportive** of your child's learning process.

By providing your child with opportunities to practice and develop their nonverbal reasoning skills, you can help them to succeed in school and in life.
