The novel begins with a group of computer programmers working on a project to create a virtual reality simulation of the world of King Arthur. One day, the programmers are testing the Camelot Code when they are suddenly transported to the real world of King Arthur. The programmers are initially confused and disoriented, but they soon begin to realize that they have a unique opportunity to use their knowledge of technology to help the people of Camelot.

The programmers quickly learn that the world of King Arthur is a dangerous place. The knights are constantly fighting each other, and the people are suffering from poverty and disease. The programmers decide to use their knowledge of technology to help the people of Camelot build a better future.

The programmers begin by teaching the people of Camelot how to use computers. They also help them to develop new technologies, such as windmills and watermills. The programmers' efforts soon begin to pay off, and the people of Camelot start to live better lives.

However, not everyone in Camelot is happy with the changes that the programmers are bringing. Some of the knights believe that the programmers are using their technology to undermine the traditional values of Camelot. The knights decide to take action against the programmers, and a battle ensues.
